

## TECHNIBOND ENVIRONMENTAL POLICY

Technibond will act responsibly in all matters concerning our business, and we recognize our duty to care for the environment. We will meet and as far as practicable surpass any legal requirements, and will act promptly in adopting new or impending requirements. We will be responsive to customer requests including the provision of information and, where appropriate, the offer of alternative materials.

We have not yet adopted a formal environmental management system, but we anticipate doing so in the future. Our main objective on waste and energy management is to be as cost effective as possible, to maintain or improve our competitiveness.

We have considered our specific environmental policies under three categories:

1) Our Internal Environment

Our policy is defined within our Health and Safety Policy. Essentially, we will provide as safe, clean and pleasant a working environment for all our employees as possible, and will encourage suggestions for improving this environment.

2) Our Local Environment

We will consider our impact on the local environment in the broadest sense. We will attempt to maximize beneficial impacts including job creation. We will attempt to minimize harmful and unwanted impacts including traffic, noise, pollution and waste.

3) The Global Environment

We will as far as practicable

- Make the most efficient use of energy and natural resources
- Minimize all sources of waste
- Use renewable rather than non-renewable resources
- Pursue the development of more efficient products and processes
- Buy from suppliers with a responsible environmental policy

We are not aware of any specific issues where our products may be causing environmental damage. We maintain an interest and awareness of environmental concerns, and should we find that any of our products are causing damage, we will work with our customers towards minimizing the problem.
